

I am

We are final year students of Sona College of Technology doing Computer Science and Engineering

I'm trying to

we are building a model by applying various machine learning algorithms find the best accurate model. And integrate to flask based web application. User can predict the disease by entering parameters in the web application.

But

before starting the project we need to brainstorm, collect relevant datasets, install libraries and complete ideation phase.

Because

Liver diseases avert the normal function of the liver. Mainly due to the large amount of alcohol consumption liver disease arises. Early prediction of liver disease using classification algorithms is an efficacious task that can help the doctors to diagnose the disease within a short duration of time

Which makes me feel

The main objective of this project is to analyze the parameters of various classification algorithms and compare their predictive accuracies so as to find out the best classifier for determining the liver disease.
